These devices use heat to transfer the color from a thermal paper to a paper or other substrate. They are used in point of sale, inventory management, document tracking, time and attendance, and laboratory and medical applications. The thermal paper used in them is cheaper and faster than the thermal paper used in a dot-matrix printer. A thermal printer accepts documents in the form of paper tape (reel) or paper-based media directly from the computer, fax machine, or other device being used to print the documents. Paper tape and paper-based media can also be processed by the printer using special equipment designed for this purpose. Paper tape can be printed using a thermal printer or other types of printers. The paper tape may be used directly by the printer, or may first be scanned into the computer.

There are many types of thermal paper, including thermal paper, thermal transfer tape, and thermal receipt paper.

Disadvantages of a thermal printer include slower printing than inkjet and dot matrix printers, and the need to replace
